UNEARTHING THE ENVIRONMENTAL IMPACT OF HUMAN ACTIVITY: A GLOBAL CO₂ EMISSION

1. INTRODUCTION

1.1 Overview

Global Warming is one of the biggest challenges currently being faced by the human race, although correlation is not causation, a likely cause of global warming is due to increased atmospheric carbon dioxide from human activity. Co₂ emission refers to the carbon emitted throughout the world. For this analysis we will be focusing on Co₂ emissions and its effect on the world we live in as we as some key factors and stats that may play a role in the emission of Co₂ globally. Fossil fuel use is the primary source of co₂. The data throws light onto how much fossil fuels are burnt, per year per nation, which amounts to an increase in Co₂ every year. Analysing Global Co₂ Emission across countries from 1975 to 2020.

1.2 Purpose

The purpose of this project is reduce the usage of carbon dioxide emission. Factories is one of the major source to release the Co₂ emission in the atmosphere. By this, we know that the which countries emit co₂ emission most .

2. Problem definition and design thinking

2.1 Empathy Map

Empathy map

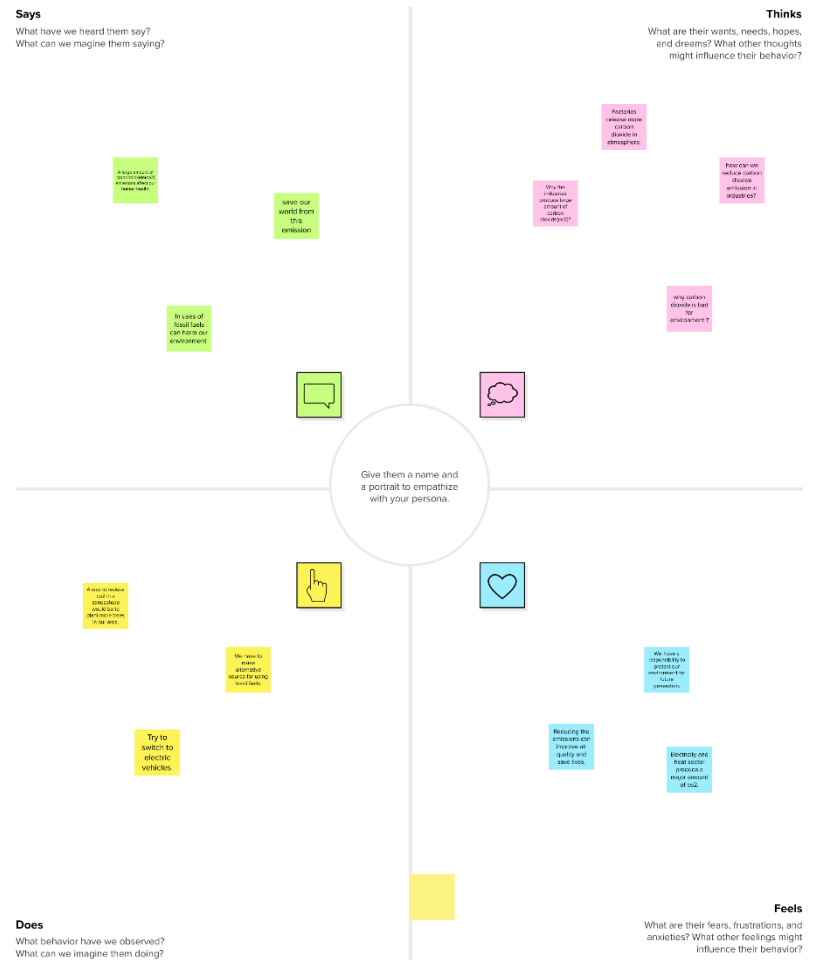

Use this framework to develop a deep, shared understanding and empathy for other people. An empathy map helps describe the aspects of a user's experience, needs and pain points, to quickly understand your users' experience and mindset.

2.2 Ideation and Brainstorming Map

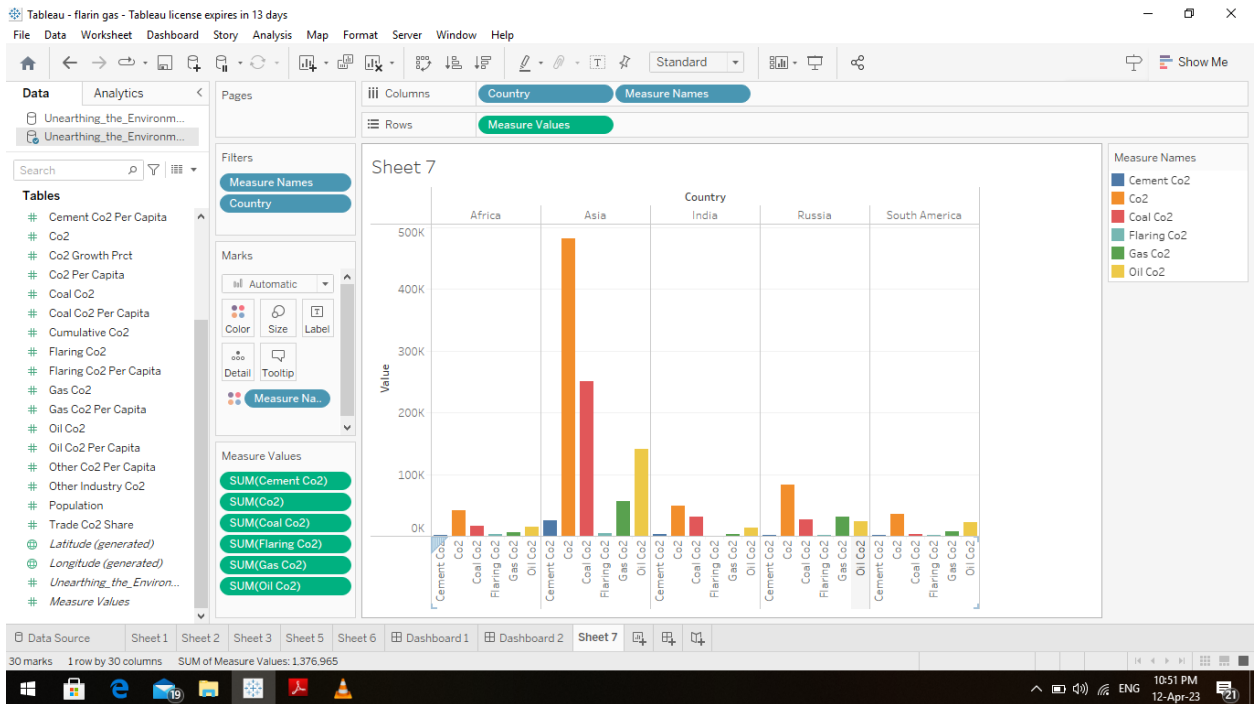

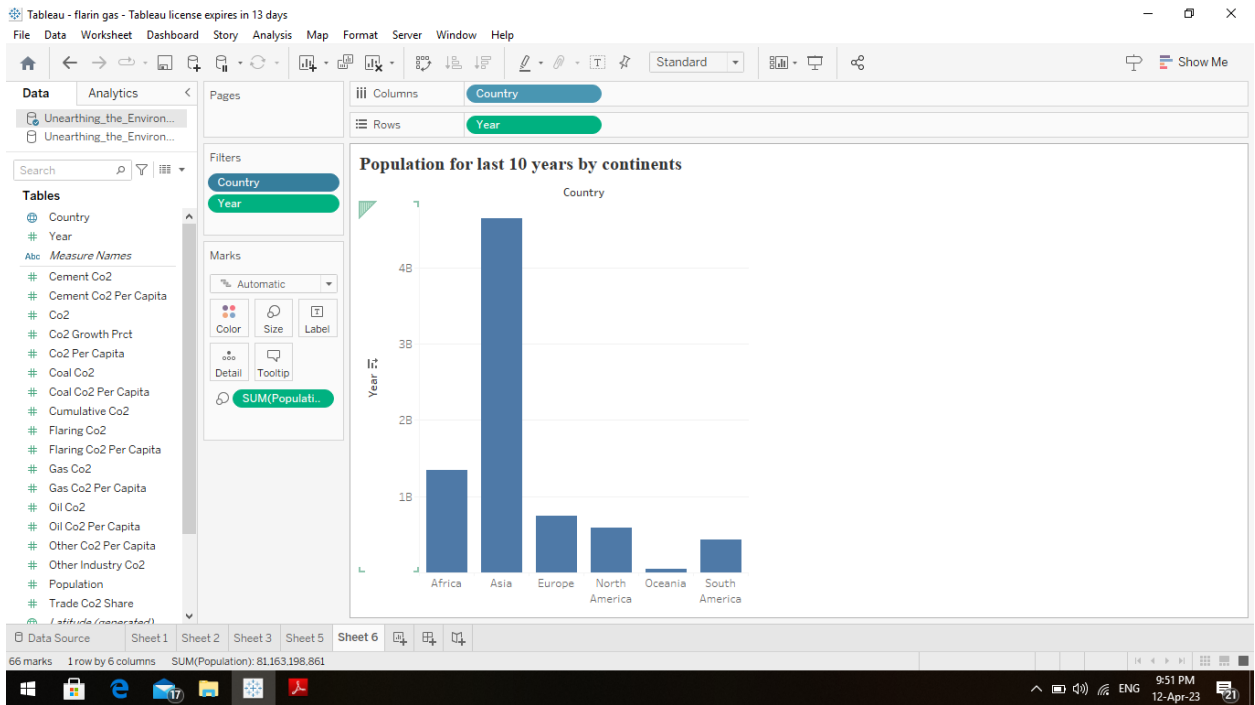

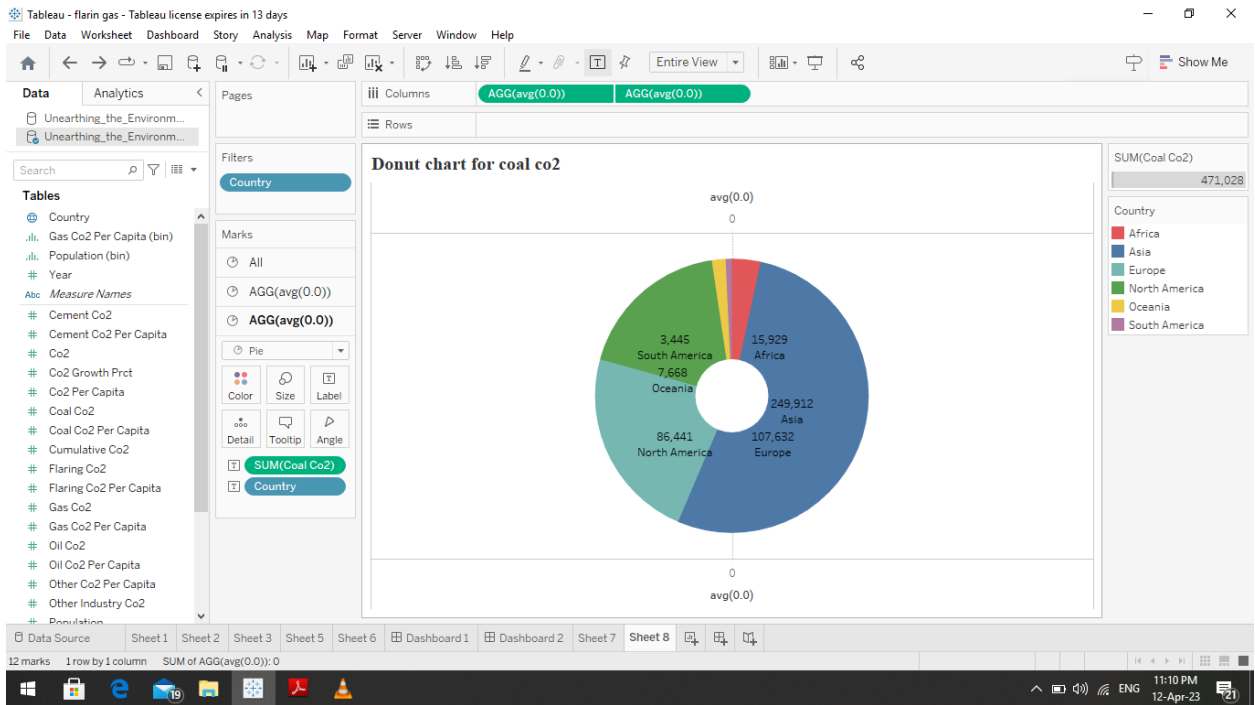

3. RESULTS

Throughout the analysis of visualizations, dashboard and story, we can conclude co2 emission in the atmosphere from 1975 – 2020 years. Likewise we can see more results. The visualization, dashboard, and story as given below:

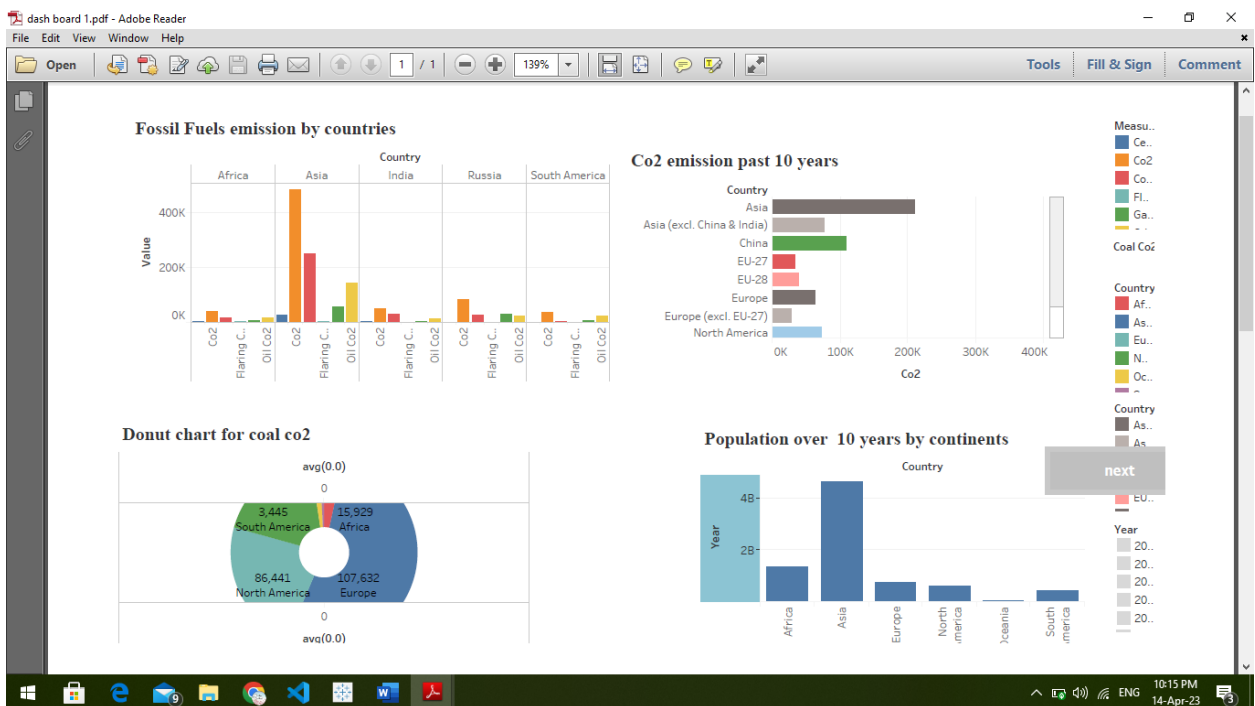

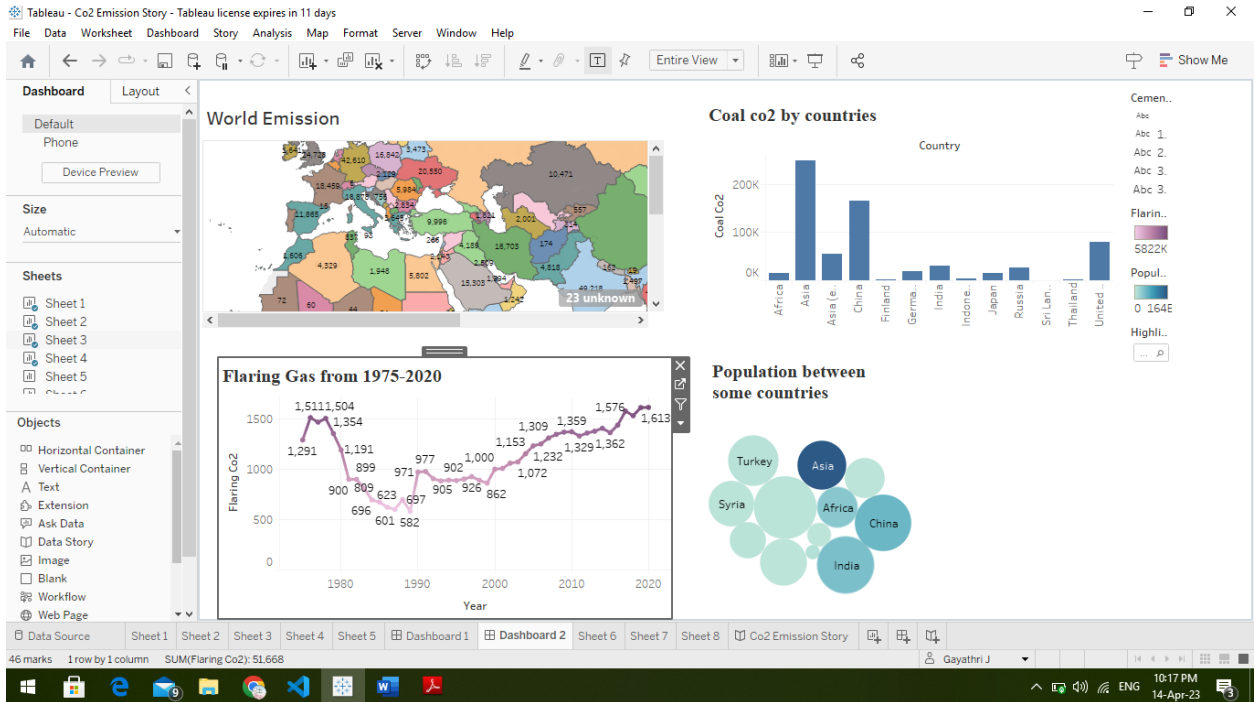

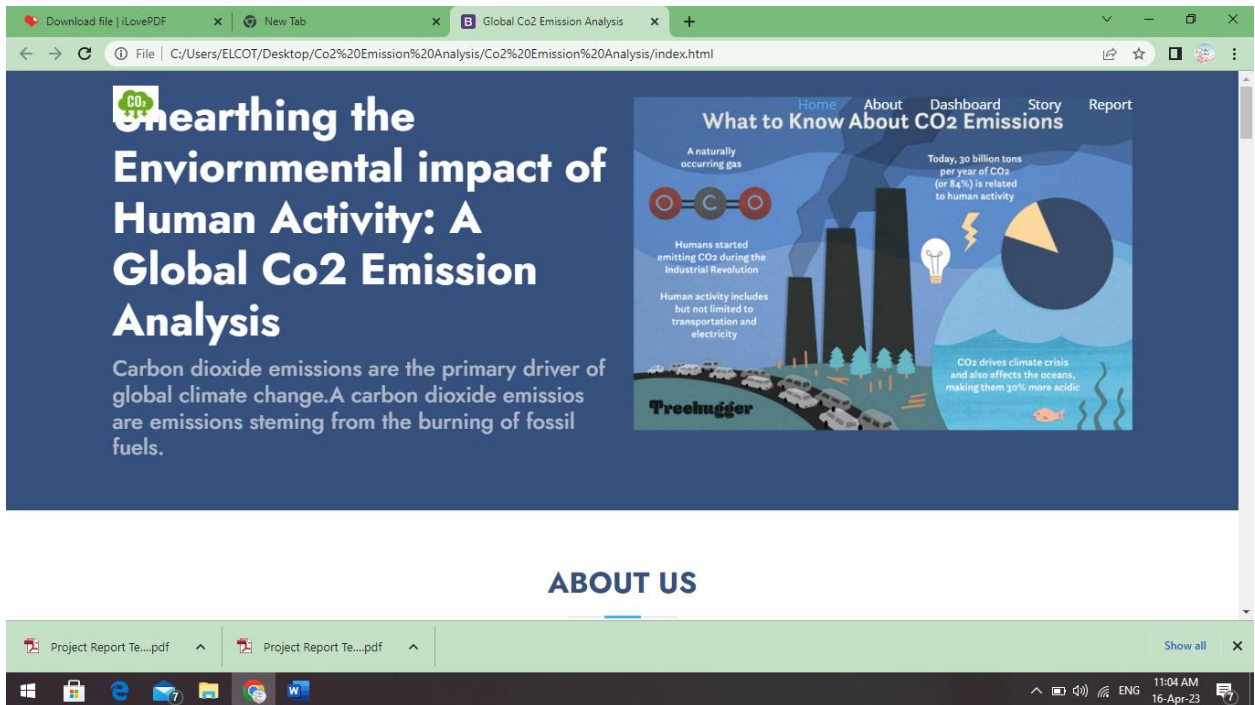

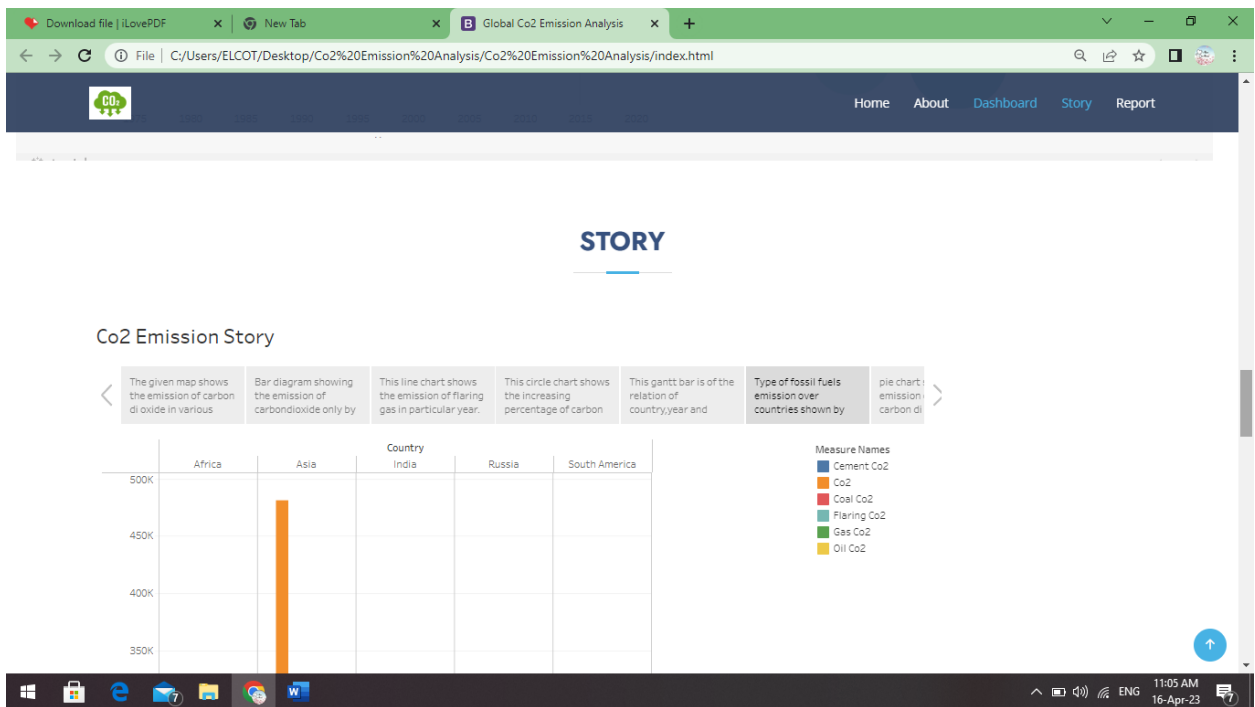

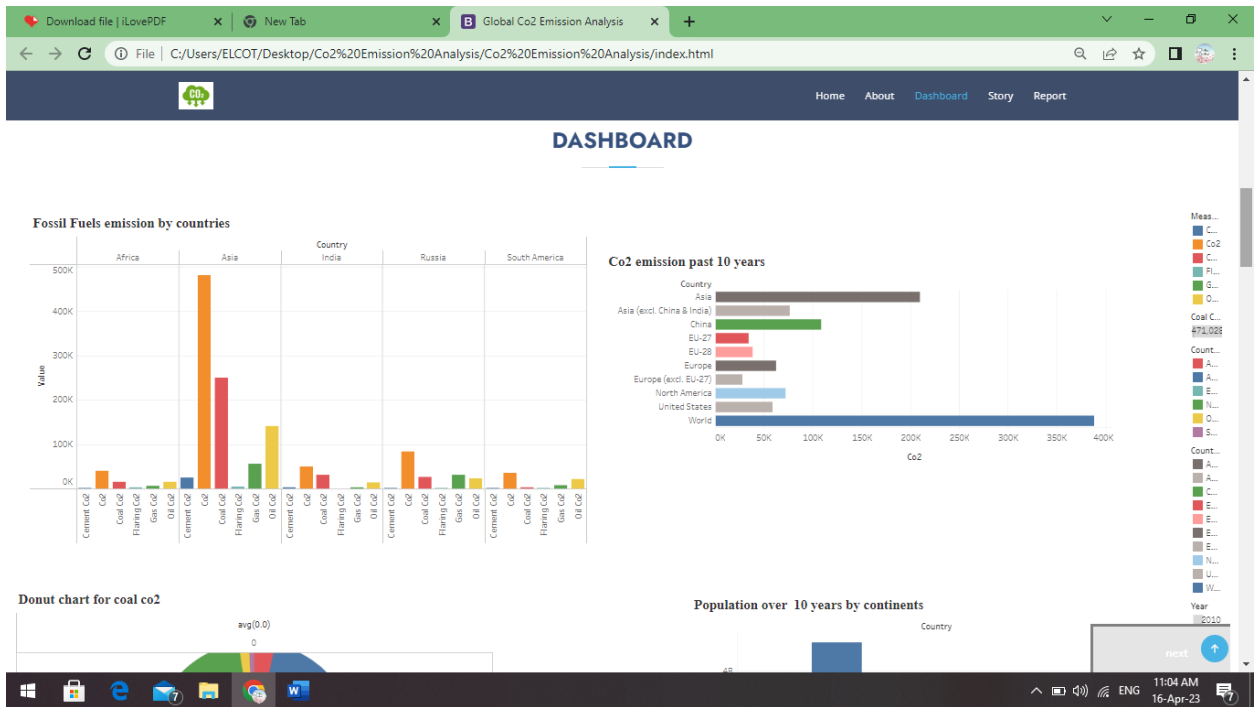

Output for Dashboards

Web Integration

4. ADVANTAGES AND DISADVANTAGES

Advantages

- Carbon dioxide is an important greenhouse gas that helps to trap heat in our atmosphere. Without it, our planet would be inhospitably cold.
- Reducing the usage of carbon dioxide emissions it improves air quality and benefits human health.

Disadvantages

- CO₂ emission has a negative impact on the environment in multiple ways, the major cause of human-induced climate change, it contributes to urban air pollution, it leads to toxic acid rain.
- Exposure to CO₂ can produce health effects. They may include headaches, dizziness, difficulty breathing, coma, asphyxia.

5. APPLICATIONS

This project survey would also explore that any existing research on CO₂ emission specifically and would aim to identify any challenges or opportunities that the countries can opt to reduce emission.

6. CONCLUSION

Asia has the highest range to emit the CO₂ over past year. By using the charts represent CO₂ emission are done and which country makes lot of emission. China has consumed the most CO₂ emission per capita.

7. FUTURE SCOPE

The future scope of this project is to reduce the usage of CO₂ emission and alternative source for using fossil fuels by bioalcohol, biodiesel, non fossil methane, propane.
